Width:	23.4"	23.4"	23.4"
Depth:	19.5"	29.5"	29.5"

The unique absorption principle originally invented by

A proprietary solution is heated and pumped into the absorber. The vapor is cooled in the **condenser** into a fluid, which runs into the low temperature **evaporator**, where it evaporates into a weak coolant atmosphere. As it evaporates, the heat transfer solution absorbs the heat and produces cold. This principle does not use a motor or compressor, generates **no vibrations** and operates with **complete silence and efficiency**.
